OUR APPROACH

PHASE 1

In this phase our Cyber Security experts understand the IT landscape and scope of work in an organization. We do environment assessment and collate the information such as Network Architecture, Application Architecture, and other IT infrastructure related information. We provide project plan with time and effort estimate for end to end testing and remediation.

PHASE 2

This phase includes thorough testing of the in-scope IT landscape, this is done in many ways like manual testing, automated testing or simulating red team exercises.

PHASE 3

This phase we evaluate all the findings on basis of severity, impact, ease of exploitation and categorize the findings or vulnerabilities into Risk ratings of High, Medium, Low with explanations, proof of concepts, and remediation recommendations. Post fixes from the organization we conduct a revalidation test for findings /issues.

OUR SERVICES

WEB APPLICATION PENETRATION TESTING:

We conduct assessments of web application for every possible flaw that could impact the security of the web application. Our goal here is to analyze all aspects of the web application and initiate attacks against those features to check whether it will cause any security failure or not by performing static and dynamic testing on these applications.

ANDROID APPLICATION PENETRATION TESTING:

Our goal here is to analyze all aspects of the mobile application and initiate attacks against those features to check whether it will cause any security failure or not by performing static and dynamic testing on these applications.

INFRASTRUCTURE PENTESTING:

We conduct assessments of client's network for every possible flaw that could impact the security of the infrastructure. Our goal here is to analyze all aspects of the organization's network infrastructure and initiate attacks against to check whether it will cause any security failure or not by performing testing on client's network.

CLOUD PENTEST:

We provide penetration testing services for Cloud Infrastructure. Our goal here is to identify and report loopholes, access management issues, vulnerabilities, etc. that can cause damage to client's cloud infrastructure and data stored over it.

THICK CLINET PENTESTING:

Thick Client Application Security Testing is an attack simulation that is intended to evaluate the security issues and vulnerabilities present in an application. Our goal here is to analyze all aspects of the application and initiate attacks against those features to check whether it will cause any security failure or not by performing static and dynamic testing on these applications.

API PENTESTING:

Our goal here is to analyze all aspects of the API calls and initiate attacks against those features to check whether it will cause any security failure.

OUR PACKAGES

ANDROID PENTEST

- Information Gathering
- Application Local Storage Flaw
- Untrusted Code
- Authentication Flaw
- Business Logic Flaws
- Authorization Flaw
- OWASP Top 10
- Pentest Reports
- Hardcoded credentials
- Memory corruption

API PENTEST

- JWT & Auth Testing
- Data Leakage
- Advance Manual Testing
- OWASP Top 10
- Authentication Flaw
- Application Login Testing
- Injection Attacks
- Authorization Flaw
- Security Headers Testing
- Acess Control Issues

WEB APPLICATION PENTEST

- General Data Protection Regulation (GDPR)
- Automated Testing
- Advance Manual Testing
- OWASP Top 10
- CWE, CVE and CVSS compliance
- Application Logic Testing
- Different User Role Testing
- SANS Top 25
- Dedicated Consultant
- Application Firewall Bypass

OUR PACKAGES

CLOUD PENTEST

- AWS
- Azure
- Google Cloud
- Misconfigurations
- Advanced Persistent Threats
- Weak Access Management
- Automated Testing
- Manual Testing
- Insecure Interfaces and APIs

NETWORK PENTEST

- Information Gathering
- Application Local Storage Flaw
- Untrusted Code
- Authentication and Authorization Flaw
- Business Logic Flaws
- Data Storage
- OWASP Top 10
- Pentest Reports
- Hardcoded credentials
- Memory corruption

THICK CLIENT PENTEST

- Application Profiling
- Authentication and Authorization Mechanism
- Session Management Mechanism
- OWASP Top 10
- Access Control Vulnerabilities
- Encryption Controls
- Input Based Vulnerabilities
- Business Logic Flaws
- Sensitive Data Storage
- DLL Hijacking

NOTE:

**ALL OF THE ABOVE PACKAGES ARE CUSTOMIZABLE AS PER
YOUR REQUIREMENTS**
